INNOVA™ IS A RANGE OF INTERIOR LINING, EXTERIOR FACADE AND FLOORING PRODUCTS WHICH GIVE A NEW DIMENSION TO THE BGC PRODUCT RANGE. THE PRODUCTS WITHIN THE INNOVA™ RANGE HAVE BEEN DESIGNED TO INSPIRE YOU TO CREATE INNOVATIVE AND DYNAMIC DESIGNS WITHIN YOUR BUILDING OR RENOVATION PROJECT.
THE DURAGRİD™ FACADE SYSTEM UTILISES BGC FIBRE CEMENT SHEETING, OFFERING THE IDEAL SOLUTION FOR CLADDING THE EXTERIOR OF HOMES AND LOW TO MEDIUM RISE COMMERCIAL CONSTRUCTION. DURAGRİD™ GIVES BUILDINGS A MODERN AND EXTREMELY DURABLE FINISH.

DURAGRİD™ SHEET HAS A SMOOTH, FLAT SURFACE AND SQUARE EDGE FINISH WHICH IS SUITABLE FOR EXPRESSED JOINTING AND PROVIDES A FACADE SUITABLE FOR A VARIETY OF PAINT FINISHES.

THE DURAGRİD™ FACADE SYSTEM:

/ IS LIGHTWEIGHT
/ IS HIGHLY DURABLE
/ PANELS WILL NOT ROT, BURN OR CORRODE
/ PANELS ARE NOT EFFECTED BY INSECTS, AIR, STEAM, SALT OR SUNLIGHT
/ CAN BE USED IN WIND ZONES UP TO AND INCLUDING EXTRA HIGH (NZS3604:2011)
/ PROVIDES A DEFINITIVE NEGATIVE DETAIL AS ONLY MINIMAL SEALANT IS REQUIRED IN THE VERTICAL JOINT
/ QUICK AND SIMPLE TO INSTALL USING MANUAL NAILING, GUN NAILING OR SCREW FIXING
/ BRANZ APPRAISED

Duragrid™ Facade System utilises BGC Fibre Cement panels and graded, timber battens to form a strong and durable facade cladding system.

Duragrid™ is ideally suited for versatile architectural applications in residential and low rise commercial construction. Duragrid™ panels can be fixed over timber framing or lightweight steel framed walls.

Duragrid™ panels are designed for installation in a variety of patterns, including vertical, horizontal or brick-bond.

Duragrid™ panels are available in 9mm thickness and may be finished with site applied acrylic paint systems or a pre-applied high quality polyurethane finish. Exposed head fasteners will need to be used with pre-finished panels. Please contact BGC Fibre Cement (NZ) for advice.

NOTE: The fitting of the Duragrid™ Facade System should only be attempted by a Licensed Building Practitioner (LBP) or specialist installer. BGC can supply a list of recommended installers.

ADVANTAGES

/ Lightweight cladding system
/ Readily accepts many forms of decorative finish
/ Highly durable
/ Dynamic architectural style
/ Fully sealed and primed panels

PRODUCT INFORMATION

Duragrid™ panels are an autoclaved, cellulose fibre reinforced silica/cement panel, specially formulated and prepared to meet the requirements for use in exterior applications. Duragrid™ panels have a smooth flat surface and a neat square edged finish, for enhanced expressed joint facades. Duragrid™ panels have been back sealed and face primed.

BGC Fibre Cement products are manufactured to the Australian / New Zealand Standard AS/NZS 2908.2-2000 Cellulose-Cement Products, Part 2: Flat sheets and Duragrid™ is classified as Type A Category 3.

SHEET TOLERANCES

/ Width +0/-1mm
/ Length +0/-2mm
/ Thickness +10%/-0%
/ Diagonals difference (max) 2mm
/ Edge straightness deviation (max) 1mm

Duragrid™ panels have relatively low thermal conductivity: R-value. At Equilibrium Moisture content the approximate R-Value of Duragrid™ is;- 0.55 W/m°C.

WEATHER RESISTANCE / FREEZE THAW

The Duragrid™ Facade system has been successfully tested for weather resistance as per NZBC Verification Method E2/VM1.

Duragrid™ should not be used in situations where it will be in direct contact with snow and ice for prolonged periods.

STRUCTURAL BRACING

Duragrid™ Facade panels are not suitable for structural bracing. Bracing can be achieved with the addition of Durabarrier as a rigid sheathing/air barrier or using Duraliner™ or Plasterboard as interior linings.

FIRE RATING

A 30/30/30 FRR can be achieved with the use of Durabarrier – see the Durabarrier brochure for details. For other Fire ratings please contact BGC Fibre Cement (NZ).
HANDLING AND STORAGE

Duragrid™ must be stacked flat, up off the ground and supported on equally spaced (max 400mm) level gluts. Care should be taken to avoid damage to the ends, edges and surfaces.

Sheets must be kept dry. When stored outdoors it must be protected from the weather. Sheets must be dry prior to fixing, jointing or finishing.

| 25mm x 10g class 4 or Stainless Steel Countersunk Wood Screws |
Fixings must comply with the minimum durability requirements of NZBC.

Zone B and C - Hot Dipped or Stainless Steel 316
Zone D - Stainless Steel 316
as per NZS3604:2011

All screw holes must be filled with an epoxy filler such as Megapoxy P1, Hilti CA125 or Hilti CA273 and sanded flush to provide a flat surface for finish coating. When sanding, only sand the screw holes, not the entire sheet surface.

The designer should determine the wind pressure for the project and specify the layout, spacing and fixing to the structure.

The timber structure should be designed to NZS3604. Alternatively the building can be to a specific design using NZS3603 and AS/NZS1170, and the framing must be of at least equivalent stiffness to the framing provisions of NZS3604.

In areas where there is a probability of high wind loading, care should be taken in the design detailing, especially around all openings, corners and other junctions, to ensure the weather resistance of the total system.

Before the Duragrid™ panels and the supporting substructure are installed, particular care should be taken to ensure that all flashing and waterproofing work is complete, including all wall underlay or BGC Durabarrier. If Duragrid™ is installed on an unlined wall i.e. gable end or garage walls then a rigid sheathing/air barrier must be installed i.e. Durabarrier.

For construction within the scope of E2/AS1, it is a requirement to have a horizontal flashing joint at the second storey for construction greater than two stories – see architectural details.

Maintain a minimum 150mm clearance from finished floor level to permanent paving or 225mm minimum to unprotected ground to comply with clause 7.5.2 of NZS3604.

Before using screws to fasten Duragrid™, precountersinking is required so that the fastener is 2mm under the sheet surface for filling with epoxy filler.

When using screws to fasten Duragrid™, pre-countersinking is required so that the fastener is 2mm under the sheet surface for filling with epoxy filler.
For in situ paint applications, Duragrid™ panels are supplied with a UV cured acrylic primer for durability.

Where it is necessary to cut sheets, cutting tools should have a dust extraction system.

Cut edges must be sealed with BGC Edge Sealer or an acrylic coating to eliminate moisture absorption.

A saw blade such as BGC Durablade with a poly crystalline diamond tip specifically designed to cut fibre cement sheets is recommended.

Ensure work area is well ventilated and wear an approved dust mask (AS/NZS1715 and AS/NZS1716) and safety glasses (AS/NZS1337).

At the horizontal joints between the Duragrid™ panels, the Horizontal Backing Strip should be bonded to the back of the Duragrid™ panel to form a socket to which the Duragrid™ panels above are fixed over.

Set the backing strip 2mm from the edge of the Duragrid™ panel. Seal the cut edge with BGC Edge Sealer.

The backing strip must be fixed using Bostik Seal ‘n’ Flex FC. It should be applied as per the diagram below. If any excess adhesive squeezes out the top allow to set prior to trimming off with a sharp knife.

Ensure that the Seal ‘n’ Flex FC has fully cured before panel installation.
**TIMBER FRAMING**

Ensure that the framing is square and work from a central datum line. The framing must be straight and true to provide a flush face to receive the panels.

BGC Recommend a maximum tolerance of 3-4mm in any 3000mm length of framing. Duragrid™ will not straighten excessively warped or distorted frames and any warping may still be visible after Duragrid™ has been applied.

Timber framing must comply with all current NZ Standards and any specific engineering design specifications.

Timber framing must be treated and have moisture contents as per the requirements of NZS3602.

Duragrid™ requires a minimum framing width of 45mm. Studs spacing must not be greater than 600mm centres. Nog/Dwang spacing must not be greater that 800mm centres.

Timber framing must have a maximum moisture content of 20% at the time of installation of BGC Durabarrier or wall underlay.

**CAVITY BATTEN**

The cavity battens on the Duragrid™ vertical sheet joints must be a 70 x 20mm H3.1 cavity batten.

Battens must only be installed on studs.

Structural cavity battens must be fixed with 65 x 2.87mm RounDrive Ring Shank Nails or 60 x 2.8mm Jolt Head Galvanised Nails. They must be fixed at maximum 300mm centres and staggered 12mm either side of the batten centre line.

Intermediate cavity battens can be 50 x 20mm H3.1 cavity battens – there is no requirement to prime or pre coat. They are fixed with 65 x 2.87mm RounDrive Ring Shank Nails or 60 x 2.8mm Jolt Head Galvanised Nails at 300mm centres and staggered 12mm either side of the batten centre line.

Where studs are at greater than 450mm centres and a flexible wall underlay is being used, a building underlay support must be installed over the underlay at maximum 300mm centres horizontally.

The vertical expressed join must coincide with the centre line of the battens. Stud centres may have to be designed to coincide with express joins.

Structural cavity battens must be joined with a 45° weather cut sloping down and away from Durabarrier or wall underlay. Join must be sealed with Bostik Seal ‘n’ Flex FC.

Ensure cavity batten and panel are correctly orientated and sealant has been applied between battens.

---

**FIXING DURAGRIDA™ TO BATTENS**

Duragrid™ can be fixed with the following fixings in all wind zones including Extra High (NZS3604:2011):

<table>
<thead>
<tr>
<th>Fixings</th>
<th>Fixing Centres</th>
<th>From Sheet Edge</th>
</tr>
</thead>
<tbody>
<tr>

<td>150mm</td>
<td>10mm</td>
</tr>
<tr>
<td>Fibre Cement Nail</td>
<td>200mm</td>
<td>15mm</td>
</tr>
<tr>
<td>30 x 2.8mm</td>
<td>200mm</td>
<td>18mm</td>
</tr>
<tr>
<td>Screws 25mm x 10g</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

All fixing types must be used in conjunction with Bostik Seal ‘n’ Flex FC. Sheets should not be fixed closer than 50mm from the Aluminum back spacer and sheet corners.

Duragrid™ must be fixed to the cavity battens via a continuous 6mm bead of Bostik Seal ‘n’ Flex FC adhesive to all contact surfaces. The intermediate batten must have 2x6mm beads of Seal ‘n’ Flex FC.

Note: Bostik Seal ‘n’ Flex FC must only be applied just prior to the installation of the Duragrid™ sheets as it is a fast cure adhesive.

Duragrid™ sheets and cavity battens must be dry and free of dust, prior to the application of Bostik Seal ‘n’ Flex FC. The adhesive sealant must not be applied at temperatures below 5°.

INSTALLATION DETAILS

The architectural intent and details of buildings vary from one designer to the next, and the variety of details would be impossible to catalogue.

The detail diagrams following are intended to assist the designer in achieving a high quality weather resistant facade.

For full architectural details see www.bgc.com.au/fibrecement or contact BGC Fibre Cement (NZ).

Architectural details and installation specifications are also available on Productspec: www.productspec.net

The designer should not deviate from the specification set out in this manual.

FIGURE 8
PANEL POSITION - FRONT VIEW
10mm Expressed Joint
Cavity Batten
Backing Strip
DuragridTM

Use the backing strip as a temporary gauge to space the vertical joint of successive boards ensuring a uniform 10mm space between successive panels.
Duragrid™ panels are to be fixed with a continuous 6mm bead of Bostik Seal ‘n’ Flex FC to all contact surfaces and 2x6mm beads for intermediate batten with required fasteners at specific centres.

Duragrid™ should be installed one panel at a time – only apply Bostik Seal ‘n’ Flex FC to the contact surfaces of the next panel to be fixed.

MOISTURE MANAGEMENT

Designers, specifiers and builders have a duty of care to identify moisture-associated risks with any individual building design.

Wall construction design should consider both the interior and exterior environments of the building to effectively manage moisture. Special consideration should be given to buildings that are in extreme climates or at higher risk of wind driven rain.

In addition, all wall openings, penetrations, junctions, connections, window heads, sills and jambs must incorporate appropriate flashing for waterproofing. All other components, materials and installation methods used to manage moisture in walls should comply with the relevant standards of the New Zealand Building Code.

FINISHING

EPOXY FILLERS

All screw holes must be filled with a 2 part epoxy or fairing cream. Ensure the surface and screw hole is clean and free of moisture prior to applying the epoxy.

Sand flush to the panel surface once cured. Refer to the epoxy manufacturer's instructions prior to use.

FLEXIBLE SEALANTS

In all vertical Express Joints a 2-3mm gap filler of Bostik Safe Seal Construction Sealant or similar BRANZ Appraised Sealant needs to be applied. This provides a secondary sealant to the system while still providing a definitive negative detail.

Ensure the gap filler is taken to the edge of the Backing Strip at the intersection of the vertical and horizontal joints.

If you intend to paint the detail the same colour as the Duragrid™, apply the Gap filler before painting.

If you intend to have black vertical joints – apply a black BRANZ appraised paintable sealant after the Duragrid™ has been painted (mask the edges of Durasheet™ with a suitable masking tape.)

PAINTING

Painting of Duragrid™ is required to meet the durability and external moisture management of the NZBC and BGC Warranty. Duragrid™ must be painted within 90 days of installation.

Duragrid™ panels must be clean, dust free and dry before painting. It can be painted any colour. Duragrid™ panels are preprimed with a UV cured priming system and ready for site applied acrylic paint. Duragrid™ panels can be pre coated with various types of finishes but will need to be installed with exposed head fasteners.

For countersunk screw installed panels the sanded epoxy must be spot primed prior to painting.

MAINTENANCE

Building owners are responsible for the maintenance of Duragrid™ facade systems. The maintenance requirements should be determined by the specifier based on the location and exposure of the building.

It is recommended that:

/ Regular cleaning at least annually of the paint finish with water and a mild detergent
/ Do not water blast
/ Inspect regularly and repair if required
/ Check ground clearances
/ Follow paint manufacturer's recommendations on recoating

For brad installed panels the brad head must be flush with the panel surface and skimmed with a suitable exterior 2 part builders filler. The skimmed area must be spot primed prior to painting. BGC Fibre Cement (NZ) recommend at least 2 coats of high build acrylic paint when brad or nail fixings have been used. For countersunk screw installations, one coat of acrylic primer and two coats of high build acrylic paint to be used. Refer to paint manufacturer's recommendations for specific details.
DISCLAIMER

The successful performance of the relevant product depends on a number of factors outside the control of BGC Fibre Cement (NZ). As such, BGC Fibre Cement (NZ) shall not be liable for the recommendations made in its literature and the performance of the products/systems including its suitability for any purpose or ability to comply with the relevant conditions set out in the New Zealand Building Code. It is the responsibility of the building designer to ensure that the details and recommendations provided in the relevant BGC Fibre Cement (NZ) installation guide are suitable for the intended project and that specific design is conducted where appropriate.

The instructions and recommendations in BGC Fibre Cement (NZ) literature are based on good building practice, but are in no way an exhaustive statement of all relevant information and are subject to conditions above. BGC Fibre Cement has tested the performance of its products when installed in accordance with the products technical specification, in accordance with the standards required by the New Zealand Building Code. Those test results demonstrate the products compliance with the performance criteria set out by the New Zealand Building Code.

WARRANTY

BGC Fibre Cement (NZ) warrants its products to be free from defects caused by defective materials or workmanship (manufacturer) for a period of 15 years from the date of purchase, subject to the conditions set out below. Further, BGC Fibre Cement (NZ) warrants its products to be resistant from rotting, fire and cracking so long as the installation is carried out in accordance with BGC Fibre Cement literature available at the time of purchase.

i) This warranty is non transferable.

ii) The product must be installed and maintained in accordance with the relevant BGC Fibre Cement (NZ) literature current and available at the time of purchase. All additional products including accessories, jointing systems and coatings used in conjunction with the BGC Fibre Cement product(s) must be applied or installed according to the appropriate manufacturer’s instructions.

iii) BGC Fibre Cement (NZ) is not liable for any breach of warranty unless the claimant provides proof of purchase and a claim is submitted in writing within 30 days of the defect becoming evident. If the defect is detected prior to installation, the claim must be submitted before installation occurs.

iv) If BGC Fibre Cement (NZ) products are found to be defective, BGC Fibre Cement will at its option, repair or replace the product, supply equivalent replacement products or reimburse the purchase price of the product.

v) BGC Fibre Cement (NZ) shall not be liable for any damage or losses (direct or indirect) including property damage or personal injury, economic loss or loss of profits, consequential loss arising in contract or negligence or howsoever arising. BGC Fibre Cement (NZ) shall not be liable for any claims, damages or defects arising from or attributed to poor workmanship, poor design or detailing, settlement or structural movement or movement of materials to which the product is attached, incorrect design of the structure, acts of God, including but not limited to floods, cyclones, earthquakes or severe weather or unusual climate conditions, performance of coatings or paints applied to the product, normal wear and tear, growth of mould, mildew, fungi, bacteria or any other organism on the products surface (exposed or unexposed).

vi) The project must be designed and constructed in accordance with all relevant requirements of the current New Zealand Building Code regulations and standards.

vii) If satisfying a claim under this warranty which involves recoating or painting of BGC Fibre Cement (NZ) products, there may be slight colour differences between the replacement product and the original products due to the effect weathering and variations in materials over time.

viii) All warranties, conditions, liabilities and obligations other than those specified in this warranty are excluded to the fullest extent allowed by the law.
BGC HAS STATE OF THE ART MANUFACTURING FACILITIES IN PERTH, WA AND DISTRIBUTION CENTRES IN ALL STATES OF AUSTRALIA AND IN NEW ZEALAND.

BGC HAS A TEAM OF TECHNICAL SPECIALISTS WHO CAN ASSIST WITH ALL SPECIFICATION AND DESIGN INFORMATION. BGC PROVIDES BUILDERS, DEVELOPERS AND ARCHITECTS WITH A RANGE OF DESIGN ALTERNATIVES AND INNOVATIVE PRODUCTS SUCH AS:

**DURASHEET™** / Fibre cement sheet for exterior applications.

**DURATEX™** / Fibre cement sheets for applied finish systems.

**DURABACKER™** / Fibre cement sheet for high build plaster coatings.

**DURABARRIER** / A rigid sheathing/air barrier for all types of timber framed construction.

**DURAPLANK™** / Wood grain and smooth fibre cement plank for exterior applications.

**DURAGRID™** / A lightweight facade giving a modern and durable finish.

**DURAGROOVE™** / A vertically grooved cladding.

**DURASCAPE™** / A base sheet with a 5mm shiplap join.

**DURALINER™** / Interior lining suitable as a substrate for tiles and is ideal for wet areas.

**NULINE™ PLUS** / Weatherboard cladding system.

**STONESHEET™** / Fibre cement stone slip substrate.

SAFE WORKING PRACTICES - PLEASE WEAR A P1 OR P2 MASK AND SAFETY GOGGLES (APPROVED TO AS/NZW1337 STANDARDS) WHILST CUTTING OR INSTALLING DURAGRID™. DURAGRID™ CAN BE SAFELY HANDLED DURING UNLOADING OR STACKING WITHOUT THE USE OF THESE PRECAUTIONS.

CLEANING UP - ALWAYS WET DOWN YOUR WORK AREA WHEN CUTTING DURAGRID™, TO ENSURE THAT DUST IS MANAGED. DISPOSE OF ANY VACUUMED DUST WITH CARE AND USING CONTAINMENT PROCEDURES.
